# Creating a Sentiment Analysis Web App

## Using PyTorch and SageMaker

Deep Learning Nanodegree Program | Deployment

Now that we have a basic understanding of how SageMaker works we will try to use it to construct a complete project from end to end. Our goal will be to have a simple web page which a user can use to enter a movie review. The web page will then send the review off to our deployed model which will predict the sentiment of the entered review.

#### Instructions

Some template code has already been provided for you, and you will need to implement additional functionality to successfully complete this notebook. You will not need to modify the included code beyond what is requested. Sections that begin with 'TODO' in the header indicate that you need to complete or implement some portion within them. Instructions will be provided for each section and the specifics of the implementation are marked in the code block with a # TODO: ... comment. Please be sure to read the instructions carefully!

In addition to implementing code, there will be questions for you to answer which relate to the task and your implementation. Each section where you will answer a question is preceded by a 'Question:' header. Carefully read each question and provide your answer below the 'Answer:' header by editing the Markdown cell.

**Note**: Code and Markdown cells can be executed using the **Shift+Enter** keyboard shortcut. In addition, a cell can be edited by typically clicking it (double-click for Markdown cells) or by pressing **Enter** while it is highlighted.

#### **General Outline**

Recall the general outline for SageMaker projects using a notebook instance.

- 1. Download or otherwise retrieve the data.
- 2. Process / Prepare the data.
- 3. Upload the processed data to S3.

about:srcdoc Seite 1 von 40

- 4. Train a chosen model.
- 5. Test the trained model (typically using a batch transform job).
- 6. Deploy the trained model.
- 7. Use the deployed model.

For this project, you will be following the steps in the general outline with some modifications.

First, you will not be testing the model in its own step. You will still be testing the model, however, you will do it by deploying your model and then using the deployed model by sending the test data to it. One of the reasons for doing this is so that you can make sure that your deployed model is working correctly before moving forward.

In addition, you will deploy and use your trained model a second time. In the second iteration you will customize the way that your trained model is deployed by including some of your own code. In addition, your newly deployed model will be used in the sentiment analysis web app.

## Step 1: Downloading the data

As in the XGBoost in SageMaker notebook, we will be using the IMDb dataset

Maas, Andrew L., et al. Learning Word Vectors for Sentiment Analysis. In *Proceedings of the 49th Annual Meeting of the Association for Computational Linguistics: Human Language Technologies*. Association for Computational Linguistics, 2011.

about:srcdoc Seite 2 von 40

## Step 2: Preparing and Processing the data

Also, as in the XGBoost notebook, we will be doing some initial data processing. The first few steps are the same as in the XGBoost example. To begin with, we will read in each of the reviews and combine them into a single input structure. Then, we will split the dataset into a training set and a testing set.

```
In [1]:
        import os
        import glob
        def read imdb data(data dir='../data/aclImdb'):
             data = \{\}
             labels = \{\}
             for data_type in ['train', 'test']:
                 data[data_type] = {}
                 labels[data_type] = {}
                 for sentiment in ['pos', 'neg']:
                     data[data_type][sentiment] = []
                     labels[data_type][sentiment] = []
                     path = os.path.join(data dir, data type, sentiment, '*.txt')
                     files = glob.glob(path)
                     for f in files:
                         with open(f) as review:
                             data[data type][sentiment].append(review.read())
                             # Here we represent a positive review by '1' and a ne
                             labels[data_type][sentiment].append(1 if sentiment ==
                     assert len(data[data_type][sentiment]) == len(labels[data_type]
                             "{}/{} data size does not match labels size".format(d
             return data, labels
```

IMDB reviews: train = 12500 pos / 12500 neg, test = 12500 pos / 12500 neg

Now that we've read the raw training and testing data from the downloaded dataset, we will combine the positive and negative reviews and shuffle the resulting records.

about:srcdoc Seite 3 von 40

```
In [3]: from sklearn.utils import shuffle

def prepare_imdb_data(data, labels):
    """Prepare training and test sets from IMDb movie reviews."""

#Combine positive and negative reviews and labels
    data_train = data['train']['pos'] + data['train']['neg']
    data_test = data['test']['pos'] + data['test']['neg']
    labels_train = labels['train']['pos'] + labels['train']['neg']
    labels_test = labels['test']['pos'] + labels['test']['neg']

#Shuffle reviews and corresponding labels within training and test se data_train, labels_train = shuffle(data_train, labels_train)
    data_test, labels_test = shuffle(data_test, labels_test)

# Return a unified training data, test data, training labels, test la return data_train, data_test, labels_train, labels_test
```

```
In [4]: train_X, test_X, train_y, test_y = prepare_imdb_data(data, labels)
print("IMDb reviews (combined): train = {}, test = {}".format(len(train_X))
```

IMDb reviews (combined): train = 25000, test = 25000

Now that we have our training and testing sets unified and prepared, we should do a quick check and see an example of the data our model will be trained on. This is generally a good idea as it allows you to see how each of the further processing steps affects the reviews and it also ensures that the data has been loaded correctly.

```
In [5]: print(train_X[100])
   print(train_y[100])
```

about:srcdoc Seite 4 von 40

I just don't see how a Concorde-New Horizons film directed by Jim Wynorsk i and featuring the acting talents of Andrew Stevens and a puppet could b e bad. It just boggles the mind, doesn't it?<br /><br />Well, let's make no mistake about it. "Munchie Strikes Back" is indeed a bad film. Munchie is a puppet who has been around for many centuries. For reasons not fully explained until the end of the film, he is sent to Earth to help a single mother and her son. The mom's problem (her main problem at least) is that she has a balloon payment due on her mortgage in two weeks...to the not-s o-tiny tune of \$20,000. Ouch. She can't come up with the money because sh e just got fired. OK...JUST is the key word in that sentence. What th e...? Was she planning on paying it off with a single paycheck? Maybe it would've been a good idea to have spent the last several years saving up for it...ya think?<br /><br />Munchie has magical powers similar to those a genie would possess...but there isn't a limit on the number of wishes y ou can make! Munchie gets the boy a bunch of fancy stuff for one night bu t then the kid asks for it to be sent back to the mall Munchie was "borro wing" it from. The annoying furball also uses his otherworldly skills to help the boy win a baseball game by means of cheating. A baseball is hit so hard that it orbits the Earth several times. Sadly, those dumb parents watching the game don't think it's at all strange. Hmm.<br /><br />Anywa y, I'd like to wrap this up because this has already drained away enough of my lifeforce as it is. You'll be truly moved by the scene where Leslie -Anne Down, playing the mother, kicks a dog which is yapping at her. Your heart will melt at her charm when she notices dollar bills fluttering dow n on her front yard and she wonders how it could be snowing during the su mmer. "Munchie Strikes Back"'s credits promised another film to follow en titled, I believe, "Munchie Hangs Ten". To date, the movie viewing public has been robbed of what would surely have been a cinematic tour de force. Heh. 1/10

The first step in processing the reviews is to make sure that any html tags that appear should be removed. In addition we wish to tokenize our input, that way words such as *entertained* and *entertaining* are considered the same with regard to sentiment analysis.

```
In [6]: import nltk
from nltk.corpus import stopwords
from nltk.stem.porter import *

import re
from bs4 import BeautifulSoup

def review_to_words(review):
    nltk.download("stopwords", quiet=True)
    stemmer = PorterStemmer()

    text = BeautifulSoup(review, "html.parser").get_text() # Remove HTML
    text = re.sub(r"[^a-zA-Z0-9]", " ", text.lower()) # Convert to lower
    words = text.split() # Split string into words
    words = [w for w in words if w not in stopwords.words("english")] # R
    words = [PorterStemmer().stem(w) for w in words] # stem

return words
```

about:srcdoc Seite 5 von 40

The review\_to\_words method defined above uses BeautifulSoup to remove any html tags that appear and uses the nltk package to tokenize the reviews. As a check to ensure we know how everything is working, try applying review\_to\_words to one of the reviews in the training set.

In [7]: # TODO: Apply review\_to\_words to a review (train\_X[100] or any other revi
example\_review\_words = review\_to\_words(train\_X[100])
print(example\_review\_words)

['see', 'concord', 'new', 'horizon', 'film', 'direct', 'jim', 'wynorski', 'featur', 'act', 'talent', 'andrew', 'steven', 'puppet', 'could', 'bad', 'boggl', 'mind', 'well', 'let', 'make', 'mistak', 'munchi', 'strike', 'ba ck', 'inde', 'bad', 'film', 'munchi', 'puppet', 'around', 'mani', 'centur i', 'reason', 'fulli', 'explain', 'end', 'film', 'sent', 'earth', 'help', 'singl', 'mother', 'son', 'mom', 'problem', 'main', 'problem', 'least', ' balloon', 'payment', 'due', 'mortgag', 'two', 'week', 'tini', 'tune', '2 0', '000', 'ouch', 'come', 'money', 'got', 'fire', 'ok', 'key', 'word', ' sentenc', 'plan', 'pay', 'singl', 'paycheck', 'mayb', 'would', 'good', 'i dea', 'spent', 'last', 'sever', 'year', 'save', 'ya', 'think', 'munchi', 'magic', 'power', 'similar', 'geni', 'would', 'possess', 'limit', 'numbe r', 'wish', 'make', 'munchi', 'get', 'boy', 'bunch', 'fanci', 'stuff', 'o ne', 'night', 'kid', 'ask', 'sent', 'back', 'mall', 'munchi', 'borrow', ' annoy', 'furbal', 'also', 'use', 'otherworldli', 'skill', 'help', 'boy', 'win', 'basebal', 'game', 'mean', 'cheat', 'basebal', 'hit', 'hard', 'orb it', 'earth', 'sever', 'time', 'sadli', 'dumb', 'parent', 'watch', 'gam

**Question:** Above we mentioned that review\_to\_words method removes html formatting and allows us to tokenize the words found in a review, for example, converting *entertained* and *entertaining* into *entertain* so that they are treated as though they are the same word. What else, if anything, does this method do to the input?

**Answer:** As already stated in the question, the method review\_to\_words does the following things: a) it removes HTML formatting, b) it converts the words into tokens using the PorterStemmer.

We can add further transformation tasks that the method applies to the input: c) it replaces all characters which are not contained in the alphanumberic data set by a space, d) it converts all characters to lower case, e) it splits up the review into single words, f) it removes the stopwords from the reviews.

about:srcdoc Seite 6 von 40

The method below applies the review\_to\_words method to each of the reviews in the training and testing datasets. In addition it caches the results. This is because performing this processing step can take a long time. This way if you are unable to complete the notebook in the current session, you can come back without needing to process the data a second time.

```
In [8]:
        import pickle
        cache_dir = os.path.join("../cache", "sentiment_analysis") # where to st
        os.makedirs(cache_dir, exist_ok=True) # ensure cache directory exists
        def preprocess_data(data_train, data_test, labels_train, labels_test,
                            cache dir=cache dir, cache file="preprocessed data.pk
            """Convert each review to words; read from cache if available."""
            # If cache file is not None, try to read from it first
            cache data = None
            if cache_file is not None:
                try:
                    with open(os.path.join(cache_dir, cache_file), "rb") as f:
                        cache data = pickle.load(f)
                    print("Read preprocessed data from cache file:", cache_file)
                except:
                    pass # unable to read from cache, but that's okay
            # If cache is missing, then do the heavy lifting
            if cache data is None:
                # Preprocess training and test data to obtain words for each revi
                #words_train = list(map(review_to_words, data_train))
                #words test = list(map(review to_words, data_test))
                words train = [review to words(review) for review in data train]
                words test = [review to words(review) for review in data test]
                # Write to cache file for future runs
                if cache_file is not None:
                    cache data = dict(words train=words train, words test=words t
                                       labels train=labels train, labels test=labe
                    with open(os.path.join(cache_dir, cache_file), "wb") as f:
                        pickle.dump(cache data, f)
                    print("Wrote preprocessed data to cache file:", cache_file)
            else:
                # Unpack data loaded from cache file
                words train, words test, labels train, labels test = (cache data[
                         cache data['words test'], cache data['labels train'], cac
            return words train, words test, labels train, labels test
```

```
In [9]: # Preprocess data
train_X, test_X, train_y, test_y = preprocess_data(train_X, test_X, train_y)
```

Read preprocessed data from cache file: preprocessed\_data.pkl

#### Transform the data

In the XGBoost notebook we transformed the data from its word representation to a bag-of-words feature representation. For the model we are going to construct in this notebook we will construct a feature representation which is very similar. To start, we will represent each word as an integer. Of course, some of the words that appear in the reviews occur very infrequently and so likely don't contain much information for the purposes of sentiment analysis. The way we will deal with this problem is that we will fix the size of our working vocabulary and we will only include the words that appear most frequently. We will then combine all of the infrequent words into a single category and, in our case, we will label it as 1.

Since we will be using a recurrent neural network, it will be convenient if the length of each review is the same. To do this, we will fix a size for our reviews and then pad short reviews with the category 'no word' (which we will label 0) and truncate long reviews.

#### (TODO) Create a word dictionary

To begin with, we need to construct a way to map words that appear in the reviews to integers. Here we fix the size of our vocabulary (including the 'no word' and 'infrequent' categories) to be 5000 but you may wish to change this to see how it affects the model.

**TODO:** Complete the implementation for the build\_dict() method below. Note that even though the vocab\_size is set to 5000, we only want to construct a mapping for the most frequently appearing 4998 words. This is because we want to reserve the special labels 0 for 'no word' and 1 for 'infrequent word'.

about:srcdoc Seite 8 von 40

```
In [10]:
         import numpy as np
         from collections import defaultdict
         def build dict(data, vocab size = 5000):
              """Construct and return a dictionary mapping each of the most frequen
             # TODO: Determine how often each word appears in `data`. Note that `d
                     sentence is a list of words.
             word count = defaultdict(int)
             for s in data:
                 for w in s:
                     word_count[w] += 1
             #print(word count)
             # TODO: Sort the words found in `data` so that sorted words[0] is the
                     sorted_words[-1] is the least frequently appearing word.
             sorted key value pairs = sorted(word count.items(), key=lambda x:x[1]
             sorted words = [key value pair[0] for key value pair in sorted key va
             #print(sorted words[:5])
             word dict = {} # This is what we are building, a dictionary that tran
             for idx, word in enumerate(sorted_words[:vocab_size - 2]): # The -2 i
                 word dict[word] = idx + 2
                                                                         # 'infrequ
             return word dict
```

```
In [11]: word_dict = build_dict(train_X)
```

**Question:** What are the five most frequently appearing (tokenized) words in the training set? Does it makes sense that these words appear frequently in the training set?

**Answer:** The 5 most frequently used token words in the training set are movi, film, one, like, and time. From a sentiment analysis' view it makes no real sense to have these words in the training set. They bear neither a negative nor a positive meaning and hence don't help to find out the sentiment of the review.

```
In [12]: # TODO: Use this space to determine the five most frequently appearing wo
list(word_dict)[:5]
Out[12]: ['movi', 'film', 'one', 'like', 'time']
```

about:srcdoc Seite 9 von 40

#### Save word\_dict

Later on when we construct an endpoint which processes a submitted review we will need to make use of the word\_dict which we have created. As such, we will save it to a file now for future use.

```
In [13]: data_dir = '../data/pytorch' # The folder we will use for storing data
    if not os.path.exists(data_dir): # Make sure that the folder exists
        os.makedirs(data_dir)

In [14]: with open(os.path.join(data_dir, 'word_dict.pkl'), "wb") as f:
        pickle.dump(word_dict, f)
```

#### Transform the reviews

Now that we have our word dictionary which allows us to transform the words appearing in the reviews into integers, it is time to make use of it and convert our reviews to their integer sequence representation, making sure to pad or truncate to a fixed length, which in our case is 500.

```
In [15]:
         def convert and pad(word dict, sentence, pad=500):
             NOWORD = 0 # We will use 0 to represent the 'no word' category
             INFREQ = 1 # and we use 1 to represent the infrequent words, i.e., wo
             working_sentence = [NOWORD] * pad
             for word index, word in enumerate(sentence[:pad]):
                  if word in word dict:
                      working sentence[word index] = word dict[word]
                  else:
                      working sentence[word index] = INFREQ
             return working sentence, min(len(sentence), pad)
         def convert_and_pad_data(word_dict, data, pad=500):
             result = []
             lengths = []
             for sentence in data:
                  converted, leng = convert_and_pad(word_dict, sentence, pad)
                  result.append(converted)
                  lengths.append(leng)
             return np.array(result), np.array(lengths)
```

```
In [16]: train_X, train_X_len = convert_and_pad_data(word_dict, train_X)
  test_X, test_X_len = convert_and_pad_data(word_dict, test_X)
```

about:srcdoc Seite 10 von 40

As a quick check to make sure that things are working as intended, check to see what one of the reviews in the training set looks like after having been processeed. Does this look reasonable? What is the length of a review in the training set?

```
In [17]:
             # Use this cell to examine one of the processed reviews to make sure ever
             review no = 101
             print(train_X[review_no])
             print('Length of the review: {}'.format(train_X_len[review_no]))
                                                                   97
                 21
                        69
                               12 4637 1629
                                                      1
                                                          864

                                                                    0
                                                                           0
                                                                                  0]
```

**Question:** In the cells above we use the preprocess\_data and convert\_and\_pad\_data methods to process both the training and testing set. Why or why not might this be a problem?

Length of the review: 101

about:srcdoc Seite 11 von 40

**Answer:** For the preprocess\_data method, which transforms the words of the reviews to the tokenized list of words, it is imperatively required to use it for both the training and the testing set. Otherwise both sets would result in different token sets, and they would hence possibly be measured differently regarding the later sentiment analysis.

For the convert\_and\_pad\_data method, on the other hand, we have the case that for both training and testing data we use a dictionary which was created using the training data only. But this is justified here, because the testing data by no means should have any influence on the model. This is due to the fact that the purpose of the testing data is exactly this: to test the model under some 'real' conditions as much as possible.

Note that this problem is different from the problem, that the underlying dictionary of the movie reviews may change with time. As an example, just imagine that a possible new great film nation will arise in the next years, and that it will introduce new words, say, from its foreign language, into the film reviews. These words won't be covered by the dictionary, and hence won't find a way into the sentiment analysis.

### Step 3: Upload the data to S3

As in the XGBoost notebook, we will need to upload the training dataset to S3 in order for our training code to access it. For now we will save it locally and we will upload to S3 later on.

#### Save the processed training dataset locally

It is important to note the format of the data that we are saving as we will need to know it when we write the training code. In our case, each row of the dataset has the form label, length, review[500] where review[500] is a sequence of integers representing the words in the review.

#### Uploading the training data

Next, we need to upload the training data to the SageMaker default S3 bucket so that we can provide access to it while training our model.

about:srcdoc Seite 12 von 40

```
In [19]: import sagemaker
sagemaker_session = sagemaker.Session()
bucket = sagemaker_session.default_bucket()
prefix = 'sagemaker/sentiment_rnn'
role = sagemaker.get_execution_role()
```

NOTE: The cell above uploads the entire contents of our data directory. This includes the word\_dict.pkl file. This is fortunate as we will need this later on when we create an endpoint that accepts an arbitrary review. For now, we will just take note of the fact that it resides in the data directory (and so also in the S3 training bucket) and that we will need to make sure it gets saved in the model directory.

input\_data = sagemaker\_session.upload\_data(path=data\_dir, bucket=bucket,

## Step 4: Build and Train the PyTorch Model

In the XGBoost notebook we discussed what a model is in the SageMaker framework. In particular, a model comprises three objects

Model Artifacts,

In [20]:

- Training Code, and
- Inference Code,

each of which interact with one another. In the XGBoost example we used training and inference code that was provided by Amazon. Here we will still be using containers provided by Amazon with the added benefit of being able to include our own custom code.

We will start by implementing our own neural network in PyTorch along with a training script. For the purposes of this project we have provided the necessary model object in the model.py file, inside of the train folder. You can see the provided implementation by running the cell below.

```
In [21]: !pygmentize train/model.py
```

about:srcdoc Seite 13 von 40

```
import torch.nn as nn
class LSTMClassifier(nn.Module):
    This is the simple RNN model we will be using to perform Sentiment An
alysis.
         init__(self, embedding_dim, hidden_dim, vocab_size):
        Initialize the model by settingg up the various layers.
        super(LSTMClassifier, self). init ()
        self.embedding = nn.Embedding(vocab size, embedding dim, padding
idx=0)
        self.lstm = nn.LSTM(embedding dim, hidden dim)
        self.dense = nn.Linear(in_features=hidden_dim, out_features=1)
        self.sig = nn.Sigmoid()
        self.word dict = None
    def forward(self, x):
       Perform a forward pass of our model on some input.
       x = x.t()
        lengths = x[0,:]
        reviews = x[1:,:]
        embeds = self.embedding(reviews)
        lstm_out, _ = self.lstm(embeds)
        out = self.dense(lstm out)
        out = out[lengths - 1, range(len(lengths))]
        return self.sig(out.squeeze())
```

The important takeaway from the implementation provided is that there are three parameters that we may wish to tweak to improve the performance of our model. These are the embedding dimension, the hidden dimension and the size of the vocabulary. We will likely want to make these parameters configurable in the training script so that if we wish to modify them we do not need to modify the script itself. We will see how to do this later on. To start we will write some of the training code in the notebook so that we can more easily diagnose any issues that arise.

First we will load a small portion of the training data set to use as a sample. It would be very time consuming to try and train the model completely in the notebook as we do not have access to a gpu and the compute instance that we are using is not particularly powerful. However, we can work on a small bit of the data to get a feel for how our training script is behaving.

## (TODO) Writing the training method

Next we need to write the training code itself. This should be very similar to training methods that you have written before to train PyTorch models. We will leave any difficult aspects such as model saving / loading and parameter loading until a little later.

about:srcdoc Seite 16 von 40

```
In [23]:
         def train(model, train loader, epochs, optimizer, loss fn, device):
             # Get model params
             #batch size = train loader.batch size
             #print(batch size)
             #n layers = model.lstm.num layers
             #print(n layers)
             #hidden dim = model.lstm.hidden size
             #print(hidden dim)
             for epoch in range(1, epochs + 1):
                 model.train()
                 total_loss = 0
                 # clip=5 # gradient clipping
                 # weight = next(model.parameters()).data
                  # h = (weight.new(n layers, batch size, hidden dim).zero ().to(de
                        weight.new(n_layers, batch_size, hidden_dim).zero_().to(dev
                  # print(h)
                  for batch in train loader:
                      batch_X, batch_y = batch
                      batch_X = batch_X.to(device)
                      batch_y = batch_y.to(device)
                      # TODO: Complete this train method to train the model provide
                      # h = tuple([each.data for each in h])
                      # print(h)
                      # zero accumulated gradients
                      optimizer.zero grad()
                      # get the output from the model
                      # output, h = model(batch X, h)
                      output = model(batch_X)
                      #loss = loss fn(output.squeeze(), batch y.float())
                      loss = loss_fn(output, batch_y)
                      loss.backward()
                      # `clip_grad_norm` helps prevent the exploding gradient probl
                      # nn.utils.clip grad norm (model.parameters(), clip)
                      optimizer.step()
                      #total loss += loss.data.item()
                      total_loss += loss.item()
                  print("Epoch: {}, BCELoss: {}".format(epoch, total loss / len(tra
```

Supposing we have the training method above, we will test that it is working by writing a bit of code in the notebook that executes our training method on the small sample training set that we loaded earlier. The reason for doing this in the notebook is so that we have an opportunity to fix any errors that arise early when they are easier to diagnose.

```
In [24]: import torch.optim as optim
    from train.model import LSTMClassifier

device = torch.device("cuda" if torch.cuda.is_available() else "cpu")
    model = LSTMClassifier(32, 100, 5000).to(device)
    optimizer = optim.Adam(model.parameters())
    loss_fn = torch.nn.BCELoss()

    train(model, train_sample_dl, 5, optimizer, loss_fn, device)

Epoch: 1, BCELoss: 0.6891287803649903
    Epoch: 2, BCELoss: 0.6797348737716675
    Epoch: 3, BCELoss: 0.6718374013900756
    Epoch: 4, BCELoss: 0.6633136630058288
    Epoch: 5, BCELoss: 0.6530989527702331
```

In order to construct a PyTorch model using SageMaker we must provide SageMaker with a training script. We may optionally include a directory which will be copied to the container and from which our training code will be run. When the training container is executed it will check the uploaded directory (if there is one) for a requirements.txt file and install any required Python libraries, after which the training script will be run.

#### (TODO) Training the model

When a PyTorch model is constructed in SageMaker, an entry point must be specified. This is the Python file which will be executed when the model is trained. Inside of the train directory is a file called train.py which has been provided and which contains most of the necessary code to train our model. The only thing that is missing is the implementation of the train() method which you wrote earlier in this notebook.

**TODO**: Copy the train() method written above and paste it into the train/train.py file where required.

The way that SageMaker passes hyperparameters to the training script is by way of arguments. These arguments can then be parsed and used in the training script. To see how this is done take a look at the provided train/train.py file.

### Step 5: Testing the model

As mentioned at the top of this notebook, we will be testing this model by first deploying it and then sending the testing data to the deployed endpoint. We will do this so that we can make sure that the deployed model is working correctly.

## Step 6: Deploy the model for testing

Now that we have trained our model, we would like to test it to see how it performs. Currently our model takes input of the form review\_length, review[500] where review[500] is a sequence of 500 integers which describe the words present in the review, encoded using word\_dict. Fortunately for us, SageMaker provides built-in inference code for models with simple inputs such as this.

There is one thing that we need to provide, however, and that is a function which loads the saved model. This function must be called <code>model\_fn()</code> and takes as its only parameter a path to the directory where the model artifacts are stored. This function must also be present in the python file which we specified as the entry point. In our case the model loading function has been provided and so no changes need to be made.

```
NOTE: When the built-in inference code is run it must import the model_fn() method from the train.py file. This is why the training code is wrapped in a main guard (ie, if __name__ == '__main__': )
```

Since we don't need to change anything in the code that was uploaded during training, we can simply deploy the current model as-is.

**NOTE:** When deploying a model you are asking SageMaker to launch an compute instance that will wait for data to be sent to it. As a result, this compute instance will continue to run until *you* shut it down. This is important to know since the cost of a deployed endpoint depends on how long it has been running for.

In other words If you are no longer using a deployed endpoint, shut it down!

**TODO:** Deploy the trained model.

about:srcdoc Seite 24 von 40

## Step 7 - Use the model for testing

Once deployed, we can read in the test data and send it off to our deployed model to get some results. Once we collect all of the results we can determine how accurate our model is.

```
In [28]: test X = pd.concat([pd.DataFrame(test X len), pd.DataFrame(test X)], axis
In [29]: # We split the data into chunks and send each chunk seperately, accumulat
         def predict(data, rows=512):
             split_array = np.array_split(data, int(data.shape[0] / float(rows) +
             predictions = np.array([])
             for array in split array:
                 predictions = np.append(predictions, predictor.predict(array))
             return predictions
In [30]:
         predictions = predict(test_X.values)
         predictions = [round(num) for num in predictions]
In [60]:
         from sklearn.metrics import accuracy score
         accuracy score(test y, predictions)
         0.84916
Out[60]:
```

**Question:** How does this model compare to the XGBoost model you created earlier? Why might these two models perform differently on this dataset? Which do *you* think is better for sentiment analysis?

**Answer:** On the one hand, the results of the current model fall behind the results of the XGBoost model that we used before. The XGBoost model had an accuracy value between 0.86 and 0.87. For example, in Lesson 2 it was 0.8694, in Lesson 3 0.86052, and in Lesson 5 -- before using new data and updating the model -- it was 0.862.

On the other hand, we can say that the difference is somewhere between 0.01 and 0.02, so it really is not very large.

Hence we can conclude that both models perform equally well on the IMDb data set which we have used here, with XGBoost performing slightly better.

In addition, we can draw some more information from the article by T Chen and C Guestrin, 'XGBoost: A Scalable Tree Boosting System' (ACM 2016), which was provided in this course in Lesson 2.

In section 6.3, the authors evaluate how the XGBoost model performs on

about:srcdoc Seite 25 von 40

classification tasks, that is, on tasks similar to the IMDb sentiment classification task that we are performing in this notebook. Both XGBoost with 0.83 and the scikit-learn, as an example for a neural net, with 0.82 perform equally well with XGBoost being slightly better -- quite similar as in our own case. When it comes to the time needed to perform the classification task in question, though, XGBoost seems to perform more than 10 times faster, as the authors say.

In the introduction to the article, Chen and Guestrin bring forward some more advantages of XGBoost, first of all its better scalability to all sorts of applications, together with its good handling of sparse data, and its parallel and distributed computing features.

Note that for the IMDb data set, we have no need of these additional advantages, as the data set is neither sparse, nor is it so large that we need an implementation on more than one machine on AWS.

Nevertheless these adavantages do count in favor of the XGBoost model.

On the other hand, the LSTM model which we use in this notebook makes use of word vectors - a technique directly related to the area of language, NLP and sentiment analysis. See A L Maas et. al., 'Learning Word Vectors for Sentiment Analysis' (Association for Computational Linguistics 2011), as introduced in Lesson 2, for further details.

Out of this point of view, it is good to have these techniques present in the learning algorithms, so as to be prepared to adapt these algorithms to possible future innovations within this area of research.

In summary, I would argue to be prepared to have both models ready at hand for the classification task. But finally I would opt for the XGBoost as it is faster and has advantages which may make it more safe for future applications.

This decision may be supported by the conclusion drawn in the article of E Culurcellio, 'The fall of RNN / LSTM' (online 2018), https://towardsdatascience.com/the-fall-of-rnn-lstm-2d1594c74ce0, accessed 30/06/2020, who looks for alternative algorithms and clearly says: "So in summary forget RNN and variants. Use attention. Attention really is all you need!"

about:srcdoc Seite 26 von 40

## (TODO) More testing

We now have a trained model which has been deployed and which we can send processed reviews to and which returns the predicted sentiment. However, ultimately we would like to be able to send our model an unprocessed review. That is, we would like to send the review itself as a string. For example, suppose we wish to send the following review to our model.

```
In [31]: test_review = 'The simplest pleasures in life are the best, and this film
```

The question we now need to answer is, how do we send this review to our model?

Recall in the first section of this notebook we did a bunch of data processing to the IMDb dataset. In particular, we did two specific things to the provided reviews.

- Removed any html tags and stemmed the input
- Encoded the review as a sequence of integers using word\_dict

In order process the review we will need to repeat these two steps.

**TODO**: Using the review\_to\_words and convert\_and\_pad methods from section one, convert test\_review into a numpy array test\_data suitable to send to our model. Remember that our model expects input of the form review\_length, review[500].

                                                  0,
                                                           0,
                                                                   0,
                                                                            0,
                                                                                     0,
                                                                                              0,
                                                                                                       0,
                                0,
                                         0,
              0,
                                                                   0,
                                                                                              0,
                       0,
                                                  0,
                                                           0,
                                                                            0,
                                                                                     0,
                                                                                                       0,
              0,
                       0,
                                0,
                                         0,
                                                  0,
                                                           0])]
```

Now that we have processed the review, we can send the resulting array to our model to predict the sentiment of the review.

```
In [76]: predictor.predict(test_data)
Out[76]: array(0.8452809, dtype=float32)
```

about:srcdoc Seite 28 von 40

Since the return value of our model is close to 1, we can be certain that the review we submitted is positive.

## Delete the endpoint

Of course, just like in the XGBoost notebook, once we've deployed an endpoint it continues to run until we tell it to shut down. Since we are done using our endpoint for now, we can delete it.

In [77]: estimator.delete\_endpoint()

about:srcdoc Seite 29 von 40

## Step 6 (again) - Deploy the model for the web app

Now that we know that our model is working, it's time to create some custom inference code so that we can send the model a review which has not been processed and have it determine the sentiment of the review.

As we saw above, by default the estimator which we created, when deployed, will use the entry script and directory which we provided when creating the model. However, since we now wish to accept a string as input and our model expects a processed review, we need to write some custom inference code.

We will store the code that we write in the serve directory. Provided in this directory is the model.py file that we used to construct our model, a utils.py file which contains the review\_to\_words and convert\_and\_pad preprocessing functions which we used during the initial data processing, and predict.py, the file which will contain our custom inference code. Note also that requirements.txt is present which will tell SageMaker what Python libraries are required by our custom inference code.

When deploying a PyTorch model in SageMaker, you are expected to provide four functions which the SageMaker inference container will use.

- model\_fn: This function is the same function that we used in the training script and it tells SageMaker how to load our model.
- input\_fn: This function receives the raw serialized input that has been sent to the model's endpoint and its job is to de-serialize and make the input available for the inference code.
- output\_fn: This function takes the output of the inference code and its job is to serialize this output and return it to the caller of the model's endpoint.
- predict\_fn: The heart of the inference script, this is where the actual prediction is done and is the function which you will need to complete.

For the simple website that we are constructing during this project, the <a href="input\_fn">input\_fn</a>
and <a href="output\_fn">output\_fn</a> methods are relatively straightforward. We only require being able to accept a string as input and we expect to return a single value as output. You might imagine though that in a more complex application the input or output may be image data or some other binary data which would require some effort to serialize.

#### (TODO) Writing inference code

Before writing our custom inference code, we will begin by taking a look at the code which has been provided.

about:srcdoc Seite 32 von 40

As mentioned earlier, the <code>model\_fn</code> method is the same as the one provided in the training code and the <code>input\_fn</code> and <code>output\_fn</code> methods are very simple and your task will be to complete the <code>predict\_fn</code> method. Make sure that you save the completed file as <code>predict\_py</code> in the <code>serve</code> directory.

**TODO**: Complete the predict\_fn() method in the serve/predict.py file.

#### Deploying the model

Now that the custom inference code has been written, we will create and deploy our model. To begin with, we need to construct a new PyTorchModel object which points to the model artifacts created during training and also points to the inference code that we wish to use. Then we can call the deploy method to launch the deployment container.

**NOTE**: The default behaviour for a deployed PyTorch model is to assume that any input passed to the predictor is a numpy array. In our case we want to send a string so we need to construct a simple wrapper around the RealTimePredictor class to accommodate simple strings. In a more complicated situation you may want to provide a serialization object, for example if you wanted to sent image data.

Testing the model

Now that we have deployed our model with the custom inference code, we should test to see if everything is working. Here we test our model by loading the first 250 positive and negative reviews and send them to the endpoint, then collect the results. The reason for only sending some of the data is that the amount of time it takes for our model to process the input and then perform inference is quite long and so testing the entire data set would be prohibitive.

about:srcdoc Seite 34 von 40

Now that we know our endpoint is working as expected, we can set up the web page that will interact with it. If you don't have time to finish the project now, make sure to skip down to the end of this notebook and shut down your endpoint. You can deploy it again when you come back.

# Step 7 (again): Use the model for the web app

**TODO:** This entire section and the next contain tasks for you to complete, mostly using the AWS console.

So far we have been accessing our model endpoint by constructing a predictor object which uses the endpoint and then just using the predictor object to perform inference. What if we wanted to create a web app which accessed our model? The way things are set up currently makes that not possible since in order to access a SageMaker endpoint the app would first have to authenticate with AWS using an IAM role which included access to SageMaker endpoints. However, there is an easier way! We just need to use some additional AWS services.

The diagram above gives an overview of how the various services will work together. On the far right is the model which we trained above and which is deployed using SageMaker. On the far left is our web app that collects a user's movie review, sends it off and expects a positive or negative sentiment in return.

In the middle is where some of the magic happens. We will construct a Lambda function, which you can think of as a straightforward Python function that can be executed whenever a specified event occurs. We will give this function permission to send and recieve data from a SageMaker endpoint.

Lastly, the method we will use to execute the Lambda function is a new endpoint that we will create using API Gateway. This endpoint will be a url that listens for data to be sent to it. Once it gets some data it will pass that data on to the Lambda function and then return whatever the Lambda function returns. Essentially it will act as an interface that lets our web app communicate with the Lambda function.

## Setting up a Lambda function

The first thing we are going to do is set up a Lambda function. This Lambda function will be executed whenever our public API has data sent to it. When it is executed it will receive the data, perform any sort of processing that is required, send the data (the review) to the SageMaker endpoint we've created and then return the result.

about:srcdoc Seite 35 von 40

#### Part A: Create an IAM Role for the Lambda function

Since we want the Lambda function to call a SageMaker endpoint, we need to make sure that it has permission to do so. To do this, we will construct a role that we can later give the Lambda function.

Using the AWS Console, navigate to the **IAM** page and click on **Roles**. Then, click on **Create role**. Make sure that the **AWS service** is the type of trusted entity selected and choose **Lambda** as the service that will use this role, then click **Next: Permissions**.

In the search box type sagemaker and select the check box next to the AmazonSageMakerFullAccess policy. Then, click on Next: Review.

Lastly, give this role a name. Make sure you use a name that you will remember later on, for example LambdaSageMakerRole. Then, click on **Create role**.

Role name: 'LambdaSageMakerRole2'

#### Part B: Create a Lambda function

Now it is time to actually create the Lambda function.

Using the AWS Console, navigate to the AWS Lambda page and click on **Create a function**. When you get to the next page, make sure that **Author from scratch** is selected. Now, name your Lambda function, using a name that you will remember later on, for example sentiment\_analysis\_func. Make sure that the **Python 3.6** runtime is selected and then choose the role that you created in the previous part. Then, click on **Create Function**.

On the next page you will see some information about the Lambda function you've just created. If you scroll down you should see an editor in which you can write the code that will be executed when your Lambda function is triggered. In our example, we will use the code below.

```
# We need to use the low-level library to interact with
SageMaker since the SageMaker API
# is not available natively through Lambda.
import boto3

def lambda_handler(event, context):
    # The SageMaker runtime is what allows us to invoke the
endpoint that we've created.
    runtime = boto3.Session().client('sagemaker-runtime')

# Now we use the SageMaker runtime to invoke our endpoint,
```

about:srcdoc Seite 36 von 40

```
sending the review we were given
    response = runtime.invoke_endpoint(EndpointName =
'**ENDPOINT NAME HERE**', # The name of the endpoint we
created
                                       ContentType =
                             # The data format that is expected
'text/plain',
                                       Body = event['body'])
# The actual review
    # The response is an HTTP response whose body contains the
result of our inference
    result = response['Body'].read().decode('utf-8')
    return {
        'statusCode' : 200,
        'headers' : { 'Content-Type' : 'text/plain', 'Access-
Control-Allow-Origin' : '*' },
        'body' : result
```

Once you have copy and pasted the code above into the Lambda code editor, replace the \*\*ENDPOINT NAME HERE\*\* portion with the name of the endpoint that we deployed earlier. You can determine the name of the endpoint using the code cell below.

```
In [107... predictor.endpoint
Out[107]: 'sagemaker-pytorch-2020-07-05-12-15-51-653'
```

about:srcdoc Seite 37 von 40

Once you have added the endpoint name to the Lambda function, click on **Save**. Your Lambda function is now up and running. Next we need to create a way for our web app to execute the Lambda function.

#### **Setting up API Gateway**

Now that our Lambda function is set up, it is time to create a new API using API Gateway that will trigger the Lambda function we have just created.

Using AWS Console, navigate to **Amazon API Gateway** and then click on **Get started**.

On the next page, make sure that **New API** is selected and give the new api a name, for example, sentiment\_analysis\_api. Then, click on **Create API**.

Now we have created an API, however it doesn't currently do anything. What we want it to do is to trigger the Lambda function that we created earlier.

Select the **Actions** dropdown menu and click **Create Method**. A new blank method will be created, select its dropdown menu and select **POST**, then click on the check mark beside it.

For the integration point, make sure that **Lambda Function** is selected and click on the **Use Lambda Proxy integration**. This option makes sure that the data that is sent to the API is then sent directly to the Lambda function with no processing. It also means that the return value must be a proper response object as it will also not be processed by API Gateway.

Type the name of the Lambda function you created earlier into the **Lambda Function** text entry box and then click on **Save**. Click on **OK** in the pop-up box that then appears, giving permission to API Gateway to invoke the Lambda function you created.

The last step in creating the API Gateway is to select the **Actions** dropdown and click on **Deploy API**. You will need to create a new Deployment stage and name it anything you like, for example prod.

You have now successfully set up a public API to access your SageMaker model. Make sure to copy or write down the URL provided to invoke your newly created public API as this will be needed in the next step. This URL can be found at the top of the page, highlighted in blue next to the text **Invoke URL**.

https://shxcfydj5d.execute-api.eu-central-1.amazonaws.com/prod

## Step 4: Deploying our web app

Now that we have a publicly available API, we can start using it in a web app. For our purposes, we have provided a simple static html file which can make use of the public api you created earlier.

In the website folder there should be a file called index.html. Download the file to your computer and open that file up in a text editor of your choice. There should be a line which contains \*\*REPLACE WITH PUBLIC API URL\*\*. Replace this string with the url that you wrote down in the last step and then save the file.

Now, if you open index.html on your local computer, your browser will behave as a local web server and you can use the provided site to interact with your SageMaker model.

If you'd like to go further, you can host this html file anywhere you'd like, for example using github or hosting a static site on Amazon's S3. Once you have done this you can share the link with anyone you'd like and have them play with it too!

Important Note In order for the web app to communicate with the SageMaker endpoint, the endpoint has to actually be deployed and running. This means that you are paying for it. Make sure that the endpoint is running when you want to use the web app but that you shut it down when you don't need it, otherwise you will end up with a surprisingly large AWS bill.

**TODO:** Make sure that you include the edited index.html file in your project submission.

Now that your web app is working, trying playing around with it and see how well it works.

**Question**: Give an example of a review that you entered into your web app. What was the predicted sentiment of your example review?

about:srcdoc Seite 39 von 40

**Answer:** My review: "This film was really bad and it not only lasted much too long, but also had a horrible story telling line which left you without any idea what the film was about. Price of the film is much too high and the audio quality was low as well, so this was not an exciting film entertainment. Do not watch it!"

I am not sure whether word groups like "this was not an exciting film" ('exciting' = positive?) or "Price of the film is much too high and the audio quality was low as well" ('too high' cancels somehow out the 'too low'?) count really as negative, but the overall sentiment was really negative so I expected the review to be rated as negative. As it was indeed:

"Your review was NEGATIVE!" was the response from our model in AWS.

#### Delete the endpoint

Remember to always shut down your endpoint if you are no longer using it. You are charged for the length of time that the endpoint is running so if you forget and leave it on you could end up with an unexpectedly large bill.

```
In [108... predictor.delete_endpoint()
In []:
```
